# Preface

In 1992, the US Congress passed the Fertility Clinic Success Rate and Certification Act. This law requires the Centers for Disease Control and Prevention (CDC) to publish pregnancy success rates for assisted reproductive technology (ART) fertility clinics in the United States. More details about the law are available online at CDC's [Fertility Clinic Success Rate and Certification Act](#) website.

Since 1995, CDC has worked in consultation with the Society for Assisted Reproductive Technology and the American Society for Reproductive Medicine to report ART success rates. This report is based on the latest available data on the type, number, and outcome of ART cycles performed in US clinics.

*The 2020 Assisted Reproductive Technology Fertility Clinic and National Summary Report* has four major sections:

- [\*\*Commonly Asked Questions About the US National ART Surveillance System\*\*](#)

This section provides background information on infertility and ART; an explanation of the data collection, analysis, and publication processes; and links to resources for people experiencing infertility or people interested in ART.

- [\*\*How to Access and Interpret Fertility Clinic Success Rates\*\*](#)

This section provides information on how to access and interpret fertility clinic success rates, which are available online for each reporting fertility clinic in the United States.

- [\*\*National ART Summary\*\*](#)

This section presents ART results and success rates from data combined from all US clinics. It provides this information in a summary table and in figures that use ART data from all reporting clinics to answer specific questions related to ART use and outcomes.

- **Appendixes**

- [\*\*Appendix A: Data Validation\*\*](#)

This section provides information about this year's data validation activities.

- [\*\*Appendix B: Glossary of Terms\*\*](#)

This section provides definitions for technical and medical terms used throughout the report.

- [\*\*Appendix C: ART Clinics\*\*](#)

This section provides the names and addresses of all reporting fertility clinics, along with a list of clinics known to be in operation in 2020 that did not report their data to CDC as required by law.

This report is intended for the general public, and the emphasis is on presenting the information in an easily understandable format. CDC hopes that this report is informative and helpful to people considering an ART procedure. Please contact us with any questions or suggestions at [artinfo@cdc.gov](mailto:artinfo@cdc.gov).

# Commonly Asked Questions About the US National ART Surveillance System

## 1. How many people in the United States experience infertility?

The latest published data on infertility in the United States available to CDC are from the 2015–2019 National Survey of Family Growth. Key findings from this survey include the following:

- About 19% of married women aged 15 to 49 years with no prior births are unable to get pregnant after 1 year of unprotected intercourse (infertility).
- About 26% of married, women aged 15 to 49 years with no prior births have difficulty getting pregnant or carrying a pregnancy to term (impaired fecundity).
- About 12% of all women aged 15 to 49 years have ever received any infertility services.

For more details, see the [National Survey of Family Growth](#) website.

## 2. What is assisted reproductive technology (ART)?

Although various definitions have been used for ART, the definition used in this report is based on the 1992 law that requires CDC to publish this report. According to this definition, ART includes all fertility treatments in which either eggs or embryos are handled outside a woman's body.

In general, ART procedures involve surgically removing eggs from a woman's ovaries, combining them with sperm in the laboratory, and returning them to a female patient or a gestational carrier or donating them to another patient. They do NOT include treatments in which only sperm are handled (such as intrauterine insemination) or procedures in which a woman takes drugs only to stimulate egg production without the intention of having eggs surgically retrieved.

The main type of ART is **in vitro fertilization (IVF)**. For some IVF procedures, fertilization involves a specialized technique known as intracytoplasmic sperm injection (ICSI). In ICSI, a single sperm is injected directly into a woman's egg.

Other types of ART exist but are rarely performed. **Gamete intrafallopian transfer (GIFT)** involves using a fiber optic instrument called a laparoscope to guide the transfer of unfertilized eggs and sperm (gametes) into a woman's fallopian tubes through small incisions in her abdomen. **Zygote intrafallopian transfer (ZIFT)** involves fertilizing a woman's eggs in the laboratory and then using a laparoscope to guide the transfer of the fertilized eggs (zygotes) into a woman's fallopian tubes.

In addition, ART is often categorized according to whether the procedure involved freezing all eggs or embryos (banking), whether the procedure used a patient's own eggs or eggs from another woman (donor), whether the eggs were frozen and thawed before use, and whether the embryos used were newly fertilized (fresh) or previously fertilized, frozen, and then thawed.

## 3. What is an ART cycle?

Because ART consists of several steps, an ART procedure is typically referred to as a **cycle** of treatment rather than a procedure at a single point in time. The start of an ART cycle is usually when a woman begins taking medication to stimulate egg production or begins monitoring with the intent of having embryos transferred. If eggs are produced, the cycle progresses to egg retrieval. Retrieved eggs can be combined with sperm to create embryos or frozen for future use. If fertilization is successful,

embryos can be selected for transfer in the same cycle or frozen for future use. If embryo transfer results in implantation, the cycle may progress to clinical pregnancy and possibly a live-birth delivery. For the purposes of ART reporting, data on all cycles that were started, even those that were discontinued before all steps were undertaken, are counted in the clinic's success rates.

#### **4. How do fertility clinics in the United States report data to CDC about their success rates?**

CDC contracts with a statistical survey research organization, Westat, to obtain the data published in this *2020 Assisted Reproductive Technology Fertility Clinic and National Summary Report* and on the [ART Fertility Clinic Success Rates](#) website (hereafter called the ART reports when discussed collectively in this publication). Westat maintains a list of all fertility clinics known to be in operation, identifies new clinics throughout the year, and tracks clinic reorganizations and closings. This list includes clinics and individual providers that are members of the Society for Assisted Reproductive Technology (SART), as well as clinics and providers that are not SART members.

Westat maintains the National ART Surveillance System (NASS), the web-based data collection system that all fertility clinics use to submit data to CDC. Clinics either electronically enter or import data into NASS for each ART cycle started in a given reporting year. SART member clinics can report directly to SART, and their data are imported into NASS. The data collected include de-identified information on the patient's medical history (such as infertility diagnoses), clinical information related to the ART procedure, and information on resulting pregnancies and births.

#### **5. Why are the ART reports published 2 to 3 years after the ART cycle was performed?**

Before success rates based on live-birth delivery can be calculated, every ART pregnancy must be followed up to determine whether a birth occurred. Therefore, the earliest possible date that clinics can report ART outcomes is about 9 to 10 months past the end of the reporting year, when all births have occurred. Thus, the results of all cycles initiated in a given year (year 1) are not known until about September or October of the following year (year 2).

After ART outcomes are known, the following occurs before ART reports are published:

- Clinics enter their data into NASS and verify that the generated clinic tables are accurate before submitting the data at the end of year 2.
- Preliminary data for fertility clinics are prepared and made available on CDC's [Chronic Disease and Health Promotion Data & Indicators](#) website in the spring of year 3.
- After CDC conducts extensive data checks, the ART Fertility Clinic Success Rates Dataset (which includes individual clinic success rates and a national summary) is published on the [Chronic Disease and Health Promotion Data & Indicators](#) website later in year 3. ART reports are published on the [ART Fertility Clinic Success Rates](#) website.

#### **6. Why do the 2020 ART reports include 2019 ART cycles?**

The ART reports contain statistics on two types of measures—noncumulative (or yearly) measures and cumulative measures. While calculations of noncumulative yearly measures (such as success rates for patients using donor eggs or embryos and general patient and cycle characteristics) are based on ART cycles performed in 2020, the calculation of cumulative success rates for patients using their own eggs requires data from two reporting years (2019 and 2020).

Cumulative success rates for patients using their own eggs represent the chance of having a baby after considering embryo transfers that occur within 1 year after an egg retrieval (either intended or actual). The cumulative success rate calculation requires a follow-up period of about 21 to 22 months after egg retrieval: 12 months for embryo transfers and 9 to 10 months for outcomes of these transfers to occur.

To calculate cumulative success rates for patients using their own eggs, we used complete information on all transfers and resulting outcomes occurring in 2019 and 2020 for patient egg retrievals that occurred in 2019.

For more information on the calculation of cumulative success rates, see question 11.

## **7. Which clinics are represented in the ART reports?**

The data in the ART reports come from 449 fertility clinics that provided and verified information about the outcomes of the ART cycles performed in their clinics.

Although almost all clinics that provided ART services in the United States during 2020 are represented in the ART reports, data from 46 clinics or individual providers are not included because they did not report as required. Clinics known to have been in operation at any time during 2020 that did not report or verify their data are listed in this report as nonreporters, as required by law (see Appendix C, 2020 Nonreporting Clinics, by State).

Given the estimated number of ART cycles performed in nonreporting clinics, we estimate that ART surveillance covered about 98% of ART cycles performed in the United States in 2020. We will continue to make every effort to include all clinics that provide ART services in future reports.

## **8. Can I use clinic success rates to measure the quality of ART services?**

Although the quality of ART services can affect the reported outcomes, patient characteristics such as age, race or ethnicity, infertility diagnosis, or existing medical conditions can also contribute to differences in ART success rates. For example, a clinic may accept patients that would be denied care from another clinic, which may result in lower success rates, even if the quality of care in the two clinics was identical.

Clinic-specific success rates provide information on ART use and the associated outcomes from each reporting clinic. However, differences in the success rates between clinics may not reflect differences in the quality of ART services.

## **9. Why aren't the clinics ranked by their success rates?**

Many factors contribute to the success of an ART procedure, and a difference in success rates between two fertility clinics may reflect differences in the characteristics of patients treated, the types of procedures performed, or other factors. More explanations on how to use the success rates and other statistics published in ART reports are in the How to Access and Interpret Fertility Clinic Success Rates section and on the [ART Fertility Clinic Success Rates](#) website.

This report should be used to help people considering an ART procedure find clinics where they can meet with ART providers to discuss their specific medical situation and their likelihood of success using ART. Contacting a clinic may also provide additional information that could be helpful in deciding whether to use ART. Because ART offers several treatment options, and because there are non-ART treatment options for infertility, many other factors may affect a person's decision. This report may be a helpful starting point for consumers to obtain information and consider their options.

## **10. Do the ART reports include all ART cycles performed by the reporting clinics?**

The ART reports include 326,468 new ART cycles performed in 2020 by the 449 clinics that reported their data as required. ART cycles started in 2020 are used to report on 2020 yearly measures (such as success rates for patients using donor eggs or embryos and general patient and cycle characteristics) and, in part, to report on cumulative success rates for patients using their own eggs from retrieval cycles performed in 2019. (See question 6 for additional details.) The 326,468 total cycles performed in 2020 excludes 7 cycles in which a new treatment procedure was being evaluated.

## **11. How are success rates determined?**

The ART reports present several measures of ART success, including the percentage of live-birth deliveries or singleton live-birth deliveries among all ART cycles or among ART cycles with at least one embryo transferred. Note that not all transfer cycles result in a pregnancy, and not all pregnancies result in a live-birth delivery. Because the ART reports are geared toward patients, the focus is on a live-birth delivery outcome, which is the delivery of one or more live infants. Singleton live-birth delivery (birth of a single live infant) is shown as a separate measure of success because, compared to a multiple live-birth delivery, it has a lower risk of adverse outcomes for mothers and infants, including cesarean section, prematurity, low birth weight, and infant disability or death.

Because of changes in clinical practice and more variation in ART treatment options, including improvements in egg and embryo cryopreservation (freezing), the field of ART is moving toward reporting cumulative success rates whenever possible. In the ART reports, success rates for patients using their own eggs are shown as cumulative success rates. These rates are calculated after accounting for all transfers of embryos that occur within 1 year after an egg retrieval. Thus, the calculation of cumulative success rates includes ART cycles performed in 2019 and 2020.

For more details about the calculation of cumulative success rates for patients using their own eggs, see the [ART Fertility Clinic Success Rates](#) website.

Calculation of success rates for patients using donor eggs, only includes ART cycles performed in 2020. For more details about the calculation of success rates for patients using donor eggs or embryos, see the [ART Fertility Clinic Success Rates](#) website.

## **12. What are my chances of getting pregnant using ART?**

ART success rates vary according to patient and treatment characteristics. These characteristics include age, type of infertility diagnosis, number of embryos transferred, type of ART procedure, use of techniques such as ICSI, and history of previous births, miscarriages, and ART cycles. CDC's Division of Reproductive Health has developed the [In Vitro Fertilization \(IVF\) Success Estimator](#) tool to estimate the chance of having a baby using IVF—the most common type of ART. Estimates are calculated based on the experiences of women and couples with similar characteristics.

## **13. What quality control steps are used to ensure data accuracy?**

To have their success rates published in the ART reports, clinics must submit their data in time for analysis, and the clinics' medical directors must verify by signature that the generated clinic tables are accurate. Then, Westat reviews the data and contacts clinics if corrections are necessary. After the data have been checked, a quality control process called validation normally begins.

During the annual validation process, members of the Westat validation team meet with a selection of reporting clinics and review medical record data for a sample of the clinic's ART cycles. For each cycle,

the validation team reviews information from the patient's medical record. The information collected is then compared with the data submitted for the ART reports. In recent years, approximately 35 reporting clinics (7% to 10% of all reporting clinics) have been randomly selected for validation. This year, a limited number of additional clinics were selected nonrandomly for targeted data validation to assess systematic reporting errors.

The data validation process does not include any assessment of clinical practice or overall recordkeeping. Validation primarily helps ensure that clinics submit accurate data. It also serves to identify any systematic problems that could cause data collection to be inconsistent or incomplete.

#### **14. Does CDC collect any data that it does not include in the annual ART reports?**

CDC uses any data collected and not included in the annual ART reports to monitor emerging practice patterns, better understand success rates by the characteristics of the patient or practice, evaluate emerging ART research questions, and monitor safety and efficacy issues related to ART treatment in order to improve maternal and child health outcomes. CDC also uses these data in the [IVF Success Estimator](#) tool, [State-Specific ART Surveillance](#) report, and scientific publications on CDC's [ART](#) website.

#### **15. How does CDC ensure the confidentiality of the ART data it collects?**

CDC has an Assurance of Confidentiality for the ART database. An assurance is a formal confidentiality protection used for projects conducted by CDC staff or contractors involving the collection or maintenance of sensitive, identifiable, or potentially identifiable information. The assurance protects the confidentiality of individuals and institutions included in ART data. The ART data are stored in a secure, limited-access, password-protected environment.

#### **16. Why don't the ART reports contain specific medical information about ART?**

The ART reports describe the average chances of success per ART cycle. Although the ART reports provide some information about factors such as age and type of infertility diagnosis, patients have many unique medical situations. This population-based registry of ART procedures cannot capture detailed information about specific medical conditions associated with infertility. Patients should consult with their doctor to understand their specific medical situation and their chances of success using ART.

#### **17. Why are statistics published by CDC different from SART's IVF Success Rate Reports?**

In 2020, 79% of all fertility clinics reporting data to CDC were SART members. Annual summary statistics of ART treatments performed in each SART member clinic are available in CDC's ART reports and on the [SART](#) website.

Discrepancies in tabulated statistics between CDC and SART tables may be due to (1) the inclusion of ART treatments performed at non-SART member clinics in CDC's ART reports; (2) differences in data submission deadlines for CDC and SART, which may result in some fertility clinics being excluded from CDC's ART reports; and (3) differences in data processing procedures, statistical methods, choice of reported measures, and data presentation.

### **18. Does CDC have any information on the women who donate eggs?**

When a woman seeks treatment for the purpose of donating her eggs, CDC asks clinics to report select demographic information on the donor and details on the stimulation and retrieval process. While CDC does not present data about egg donors in the ART reports, success rates for cycles using donor eggs or embryos derived from donor eggs are presented.

### **19. Are there any medical guidelines for ART performed in the United States?**

The American Society for Reproductive Medicine (ASRM) and SART issue guidelines for specific ART practices, such as the number of embryos to be transferred in an ART procedure. More information is available from the [ASRM](#) and [SART](#) websites.

### **20. Where can I get additional information on US fertility clinics?**

For more information on specific clinics, contact the clinic directly (see Appendix C: ART Clinics for contact information). SART can also provide general information about its member clinics (call 205-978-5000 or visit the [SART](#) website).

### **21. What resources are available for people experiencing infertility or people interested in ART?**

Resources for people experiencing infertility can be found on CDC's [Infertility FAQs](#) website under Related Links. CDC's [IVF Success Estimator](#) tool is also available online. Resources for people interested in ART can be found on CDC's [What Is Assisted Reproductive Technology?](#) website under Related Resources.

### **22. What's new in the 2020 ART reports?**

CDC continuously strives to present the most accurate and relevant ART fertility clinic success rates to help guide potential patients' decisions. For the first time, detailed explanations about the calculation of success rates are only available online at the [ART Fertility Clinic Success Rates](#) website.

In 2020, changes were made to the clinic selection process for data validation. A limited number of additional clinics were selected nonrandomly for targeted data validation to assess systematic reporting errors. Targeted validation results from nonrandomly selected clinics are not included in the calculation of discrepancy rates presented in Appendix A since they cannot be generalized to all reporting clinics. This change is consistent with the final notice published in the [Federal Register](#) in April 2021.

# How to Access and Interpret Fertility Clinic Success Rates

Fertility clinic success rates and clinic profiles are available on CDC's [ART Fertility Clinic Success Rates](#) website. The information in this section is intended to help consumers navigate and understand the information presented on the ART website. It can also help them interpret fertility clinic success rates based on the latest data from the National ART Surveillance System (NASS).

## National Summary Data

To view [pooled data from all US reporting clinics](#), select the link above or below the US map on the main ART web page. This link will take you to a summary of patient and cycle characteristics and ART success rates from all reporting clinics in the United States combined.

## Finding a Fertility Clinic in Your Area

You can use the information on the ART website to find a fertility clinic in your area in several ways. You can find all fertility clinics known to be in operation during the reporting year in any of the 50 US states, the District of Columbia, and Puerto Rico by selecting a location on the national map or from the drop-down menu below the map.

You can also find operating fertility clinics by entering your zip code and a mile radius below the map. A list of all operating clinics that satisfy your search criteria will be shown. Selecting a fertility clinic from the list will take you to the individual clinic page, which has five navigation tabs: (1) Clinic Services and Profile, (2) Patient and Cycle Characteristics, (3) Success Rates: Patients Using Own Eggs, (4) Success Rates: Patients Using Donor Eggs, and (5) Clinic Data Summary. The information presented under each tab, as well as information about how to interpret the success rates, is described below.

## Clinic Services and Profile

The Clinic Services and Profile navigation tab provides an overview of clinic services, the clinic's contact information, a map showing the clinic's location, the name of the clinic's medical director, and summary statistics.

## Patient and Cycle Characteristics

The Patient and Cycle Characteristics navigation tab summarizes the types of ART services performed and the kinds of patients who received ART procedures in a specific clinic. You can use the drop-down menu to select a patient or cycle characteristic of interest. You can select the Show National Data box to view national data for the selected characteristic.

## ART Success Rates Interpretation

Because ART success depends on whether patients are using their own eggs or donor eggs, the navigation tab for Success Rates presents information separately for these two groups. You can use the drop-down menu to select a success rate of interest. You can also view success rates for patients with a specific diagnosis by using the filter function on the left. You can select the Show National Data box to view national data for the selected success rate of interest.

An ART cycle starts when a woman begins taking fertility drugs or having her ovaries monitored for follicle production with the intent to retrieve eggs (intended retrieval). If eggs are produced, the cycle progresses to egg retrieval, in which at least one egg is retrieved (actual retrieval). Retrieved eggs are either combined with sperm to create embryos or frozen for future use (egg cryopreservation).

If fertilization is successful, at least one embryo may be selected for transfer. The embryos may be transferred to the patient or to a gestational carrier (embryo transfer). Other embryos can be frozen for future use (embryo cryopreservation). If embryo transfer results in implantation, the cycle may progress to clinical pregnancy and, possibly, a live-birth delivery.

## **Interpretation of Fertility Clinic Success Rates**

Many people considering ART will want to use the information presented on the [ART Fertility Clinic Success Rates](#) website to find the “best” clinic. However, comparisons between clinics must be made with caution. Many factors contribute to the success of an ART procedure. Some factors are related to the training and experience of the fertility clinic and laboratory professionals and the quality of services they provide. Other factors are related to the patients themselves, such as their age, the quality of their eggs and sperm, the cause of their infertility, and genetic factors. Some clinics may be more willing than others to accept patients with low chances of success or may specialize in ART treatments that attract particular types of patients.

We encourage consumers considering ART to contact clinics to discuss their specific medical situations and their potential for success using ART. Because clinics did not have the opportunity to provide narratives to explain their data, such conversations could provide additional information to help consumers decide whether to use ART.

Although ART offers important options for the treatment of infertility, the decision to use ART involves many factors in addition to success rates. Therefore, consumers should carefully examine all related financial, psychological, and medical issues before beginning treatment. They may also want to consider the location of the clinic, the counseling and support services available, and the rapport that staff members have with their patients.

Other important factors to consider when using success rates to assess a clinic include the following:

- **ART statistics are from cycles performed more than 1 year ago.**

Before success rates can be calculated, the following must occur: (1) ART treatments need to be completed; (2) completed cycles need to be followed up to determine whether a birth occurred; (3) data need to be collected, reported, cleaned, and analyzed; and (4) the ART reports need to be prepared for publication.

Noncumulative yearly success rates for patients using donor eggs or embryos are calculated using only information on transfers performed in 2020. Cumulative success rates for patients using their own eggs are calculated using egg retrievals performed in 2019 and all transfers of embryos that occurred within 1 year after an egg retrieval. Thus, the calculation of cumulative success rates includes ART cycles performed in 2019 and 2020.

Many factors that contribute to a clinic’s success rates can change after the cycles included in the data presented here were performed. Personnel may be different, and equipment and training may or may not have been updated. As a result, the success rates may not necessarily represent current practice.

- **Success rates may vary.**

A clinic's success rates may vary from year to year, even if all determining factors remain the same. The more cycles that a clinic carries out, the less the rate is likely to vary. Clinics that perform fewer cycles are likely to have more variability in success rates from year to year. As an extreme example, if a clinic reports only one ART cycle in a given category, as is sometimes the case in the data presented here, the clinic's success rate in that category would be either 0% or 100%.

- **Some clinics treat more than the average number of patients with difficult infertility problems.**

Some clinics offer ART to most potential patients, even those who have a low probability of success. Others discourage such patients or encourage them to use donor eggs, a practice that results in higher success rates among older patients. Clinics that accept a higher percentage of patients who previously have had multiple unsuccessful ART cycles will generally have lower success rates. In contrast, clinics that offer ART procedures to patients who might have become pregnant with less technologically advanced treatment will generally have higher success rates. CDC does not collect information on clinic-specific patient selection practices.

- **The number of embryos transferred varies from clinic to clinic.**

ASRM and SART discourage the transfer of a large number of embryos because of the increased likelihood of multiple-fetus pregnancies. Multiple-fetus pregnancies, in turn, increase the probability of premature births and related health problems.

## **Success Rates: Patients Using Own Eggs**

The Success Rates: Patients Using Own Eggs navigation tab provides data on success rates for patients who used their own eggs. Because ART success depends on whether patients are using ART for the first time or had prior ART cycles, a drop-down menu allows users to examine success rates for all "Patients using their own eggs" or for "Patients with no prior ART using their own eggs." "Patients using their own eggs" includes both patients with prior ART and those with no prior ART.

Success rates for patients using their own eggs are shown per intended retrieval, per actual retrieval, and per transfer. The average number of transfers per intended retrieval and the average number of intended retrievals per live-birth delivery are also shown. The success rates presented on this page are cumulative success rates and include embryo transfers that occur within 1 year after an egg retrieval. Calculation of cumulative success rates requires data from two reporting years for patients using their own eggs. This page excludes cycles that were considered research—that is, cycles performed to evaluate new procedures. Success rates can be filtered by diagnosis and by age of patient.

## **Success Rates: Patients Using Donor Eggs**

The Success Rates: Patients Using Donor Eggs navigation tab provides data on success rates for ART cycles that involve the transfer of embryos created from donor eggs or embryos. Intended female parents who have premature ovarian failure (early menopause), whose ovaries have been removed, who have a genetic concern about using their own eggs, or who are of older ages may consider using eggs donated by a woman without these conditions. Embryos may also be donated by patients who previously used ART. Embryos may be transferred to the intended parent or to a gestational carrier.

Success rates presented on this page are noncumulative. They are based on donor cycles started in 2020 that had embryo transfers, regardless of when the donor eggs were retrieved. This page also includes cycles in which intended parents transferred donated embryos in 2020. It excludes cycles that were considered research—that is, cycles performed to evaluate new procedures.

Success rates on this page are also presented by types of embryos and eggs used in the transfer. They are not presented by age group because previous data show that an intended parent's age does not substantially affect success when using donor eggs or embryos.

## **Clinic Data Summary**

The Clinic Data Summary navigation tab provides a full snapshot of each clinic's services and profile, patient characteristics, and ART success rates. However, comparison of success rates across clinics may not be meaningful because of differences in patient populations and ART treatment methods. Patient medical characteristics—such as age, diagnosis, and ovarian reserve—affect the success of ART treatment.

The success rates on this page do not reflect any one patient's chance of success. Patients should consult with a doctor to understand their chance of success based on their own characteristics.

# National ART Summary

## Introduction

Data from clinics in the United States that use [ART](#) to treat infertility are a rich source of information about the factors that contribute to a successful ART treatment, which is the delivery of a healthy infant. Pooling the data from all reporting clinics provides a national picture that could not be obtained by examining data from an individual clinic.

This section includes data from the 449 US fertility clinics in operation in 2020 that provided and verified data on the outcomes of all ART cycles started in their clinics. ART cycles include any process in which (1) an ART procedure is performed, (2) a woman has undergone ovarian stimulation or monitoring with the intent of having an ART procedure, or (3) frozen embryos have been thawed with the intent of transferring them to a woman. For example, an ART cycle could include an embryo transfer from a previously frozen embryo. Another cycle could include stimulation, egg retrieval, and embryo transfer.

Of the 326,468 new ART cycles reported in 2020, a total of 203,164 (62%) were started with the intent to transfer at least one embryo. Among these 203,164 cycles, there were 165,041 embryo transfers. These embryo transfers resulted in 91,453 pregnancies, 75,023 live-birth deliveries (delivery of one or more living infants), and 79,942 infants. The other 123,304 cycles (38%) were banking cycles, where eggs or embryos were cryopreserved (frozen) and stored for potential future use. The 326,468 new ART cycles started in 2020 do not include 7 research cycles that were designed to evaluate a new treatment procedure.

A patient's chances of having a pregnancy and live-birth delivery when using ART are influenced by many factors. Some of these factors are patient-related, such as the patient's age or the cause of infertility. Others are clinic-related, such as a clinic's patient selection practices.

Average chances, however, do not necessarily apply to a particular individual or couple. To help patients estimate their chance of having a baby through in vitro fertilization (IVF), the most common type of ART, CDC developed the [IVF Success Estimator](#) tool. This tool uses information about the experiences of women and couples with similar characteristics to estimate a person's chance of having a baby. These estimates are based on the available data and may not be representative of an individual patient's specific experience. In addition, the IVF Success Estimator does not provide medical advice, diagnosis, or treatment. Couples should talk with their doctor about their specific treatment plan and potential for success.

The **National Summary Table** in this section provides a full snapshot of clinic services, clinic profiles, patient characteristics, and ART success rates. It combines information from all individual clinic data summaries presented on CDC's [ART Fertility Clinic Success Rates](#) website.

The **National Summary Figures** in this section include ART cycles started in 2020 as described above and provide information about patients who use ART, their reasons, and the types of procedures performed. They also provide data on pregnancy and infant outcomes and 10-year trends of the types of procedures performed and pregnancy outcomes. The figures include ART cycles that used fresh or frozen embryos from a female patient's own eggs or eggs from another woman (donor eggs). The National Summary Figures are noncumulative and based only on ART cycles performed in 2020. They cannot be used to calculate cumulative success rates. For ART cycles performed in 2020, pregnancy outcomes may have occurred in 2020 or 2021.

# National Summary Table

An accessible version of this table is available on the [Assisted Reproductive Technology \(ART\) Data](#) website under the Clinic Data Summary tab.

## NATIONAL SUMMARY

**DISCLAIMER:** Patient medical characteristics, such as age, diagnosis, and ovarian reserve, affect the success of ART treatment. Comparison of success rates across clinics may not be meaningful due to differences in patient populations and ART treatment methods. The success rates displayed here do not reflect any one patient's chance of success. Patients should consult with a doctor to understand their chance of success based on their own characteristics.

### Cumulative ART Success Rates for Intended Retrievals Among Patients Using Their Own Eggs<sup>a,b,c</sup> Number of reporting clinics: 449

	Patient Age			
	<35	35–37	38–40	>40
<b>All patients (with or without prior ART cycles)</b>				
<b>Number of intended retrievals</b>	53,163	32,979	32,490	29,703
Percentage of intended retrievals resulting in live-birth deliveries	51.1%	37.1%	23.7%	7.6%
Percentage of intended retrievals resulting in singleton live-birth deliveries	47.2%	34.6%	22.1%	7.2%
<b>Number of retrievals</b>	50,222	30,120	28,609	24,313
Percentage of retrievals resulting in live-birth deliveries	54.1%	40.6%	26.9%	9.3%
Percentage of retrievals resulting in singleton live-birth deliveries	50.0%	37.9%	25.1%	8.8%
<b>Number of transfers</b>	54,572	26,895	19,075	9,482
Percentage of transfers resulting in live-birth deliveries	49.8%	45.5%	40.4%	23.9%
Percentage of transfers resulting in singleton live-birth deliveries	46.0%	42.4%	37.7%	22.6%
Average number of intended retrievals per live-birth delivery	2.0	2.7	4.2	13.1
<b>New patients (with no prior ART cycles)</b>				
Percentage of new patients having live-birth deliveries after 1 intended retrieval	55.1%	40.5%	26.4%	8.2%
Percentage of new patients having live-birth deliveries after 1 or 2 intended retrievals	60.8%	47.4%	33.1%	11.2%
Percentage of new patients having live-birth deliveries after all intended retrievals	61.8%	48.8%	35.3%	12.5%
Average number of intended retrievals per new patient	1.2	1.3	1.4	1.5
Average number of transfers per intended retrieval	1.1	0.8	0.6	0.3

### Noncumulative ART Success Rates for Transfers Among Patients Using Eggs or Embryos from a Donor or Donated Embryos<sup>a,b,c,d</sup>

	Fresh Embryos Fresh Eggs	Fresh Embryos Frozen Eggs	Frozen Embryos	Donated Embryos
<b>Number of transfers</b>	1,104	2,391	14,951	2,705
Percentage of transfers resulting in live-birth deliveries	54.7%	47.4%	47.7%	40.9%
Percentage of transfers resulting in singleton live-birth deliveries	49.5%	44.1%	44.5%	36.0%

### Characteristics of ART Cycles<sup>a,b</sup>

	Patient Age				Total
	<35	35–37	38–40	>40	
<b>Total number of cycles</b>	121,539	76,129	65,365	63,435	326,468
Percentage of intended egg retrieval cycles without any eggs retrieved <sup>e</sup>	5.0%	7.2%	10.1%	14.2%	8.4%
Percentage of cycles discontinued after retrieval and before transfer or banking <sup>f</sup>	9.9%	10.4%	13.2%	19.4%	12.5%
Percentage of cycles for fertility preservation	7.4%	9.5%	7.8%	4.3%	7.4%
Percentage of transfers using a gestational carrier	2.9%	3.7%	4.6%	10.3%	4.7%
Percentage of transfers using frozen embryos	81.4%	83.6%	82.4%	78.3%	81.6%
Percentage of transfers of at least 1 embryo with ICSI	80.5%	79.2%	77.2%	68.4%	77.4%
Percentage of transfers of at least 1 embryo with PGT	43.0%	52.9%	54.6%	46.0%	48.0%

### Current Services and Profile (percentage of clinics)

Donor eggs?	89%	Verified lab accreditation
Donated embryos?	63%	
Embryo cryopreservation?	100%	Yes 88% No 10% Pending 2%
Egg cryopreservation?	99%	
Gestational carriers?	90%	
SART member?	80%	

### Reason for Using ART<sup>a,b,g</sup>

Male factor	28%	Diminished ovarian reserve	28%
Endometriosis	7%	Egg or embryo banking	38%
Tubal factor	11%	Recurrent pregnancy loss	6%
Ovulatory dysfunction	14%	Other factor, infertility	28%
Uterine factor	6%	Other factor, non-infertility	5%
PGT	16%	Unexplained factor	10%
Gestational carrier	2%		

ART = assisted reproductive technology; ICSI = intracytoplasmic sperm injection; PGT = preimplantation genetic testing (diagnosis or screening)  
SART = Society for Assisted Reproductive Technology.

<sup>a</sup> Numbers and percentages exclude 7 research cycle(s) that were evaluating new procedures.

<sup>b</sup> Fractions are used when the denominator is less than 20. Reported sample sizes of 1 through 4 were suppressed due to small sample size.

<sup>c</sup> A live birth is defined as the delivery of one or more infants with at least one born alive. Multiple-birth deliveries (such as twins) with at least one live-born infant are counted as one live birth. Success rates for cycles using a patient's own eggs are calculated by using all cycles started in 2019 with the intent to retrieve a patient's eggs and all transfers of embryos created from these eggs started within 12 months of the start of the retrieval cycle. Success rates for cycles using a donor's eggs or donated embryos are calculated by using all transfers started in 2020.

<sup>d</sup> Patients of all ages are combined because previous data show that a patient's age does not substantially affect success when using a donor's eggs or donated embryos.

<sup>e</sup> Includes cycles in which no eggs were retrieved among all cycles in which egg retrieval was intended.

<sup>f</sup> Includes cycles in which no eggs or embryos were transferred or frozen among all cycles in which eggs were retrieved and all frozen cycles.

<sup>g</sup> Reasons may add to more than 100% because more than one diagnosis can be reported for each ART cycle.

# National Summary Figures

Figure 1 shows the distribution of the 326,468 ART cycles started in 2020 in the United States, by patient age group. The largest percentage of ART cycles performed was among patients younger than age 35. This age group represented 37.2% of all cycles, compared to 23.3% among patients aged 35–37, 20.0% among those aged 38–40, 9.4% among those aged 41–42, and 10.1% among those older than age 42. The average age of patients using ART services in 2020 was 36.2 years.

Figure 1

ART Use by Age Group, United States, 2020

**Figure 2** shows the outcomes of the 91,453 clinical pregnancies from ART cycles started in 2020. A clinical pregnancy is a pregnancy that is confirmed by ultrasound. About 82% of clinical pregnancies from ART cycles started in 2020 resulted in a live-birth delivery. Of clinical pregnancies, 76.7% resulted in the birth of a single infant, while 5.3% resulted in the birth of multiple infants. Clinical pregnancies that did not result in a live-birth delivery included miscarriage (15.7%) and stillbirth (0.5%). For 1.8% of pregnancies, the outcome was reported as other or unknown.

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded. Both miscarriage and stillbirth describe pregnancy loss, but they are categorized according to when the loss occurs. Miscarriage (also called spontaneous abortion) is a pregnancy ending in the spontaneous loss of the embryo or fetus before 20 weeks of gestation. Stillbirth, or fetal death, is pregnancy loss at 20 weeks or more of gestation.

**Figure 2**  
Outcomes of Clinical Pregnancies Resulting From ART, United States, 2020

**Figure 3** shows the percentage of embryo transfer cycles started in 2020 that resulted in live-birth delivery of one or more live infants, by patient age and egg or embryo source.

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded.

The percentage of embryo transfer cycles that used patient eggs or embryos and resulted in live-birth delivery generally decreased as the age of the woman increased (range: 10.6%–42.7%) because the likelihood of a fertilized egg implanting is related to the age of the woman who produced the egg. In contrast, 41.4% of embryo transfer cycles using donor eggs or embryos resulted in live-birth delivery for women of all ages (range: 37.6%–48.5%) because egg donors are typically in their 20s or early 30s and do not have infertility.

**Figure 3**

Percentage of Embryo Transfers That Resulted in Live-Birth Delivery, by Patient Age and Egg or Embryo Source, United States, 2020

**Figure 4** shows the distribution of reported reasons for ART cycles started in 2020. Percentages for each reason were as follows: 38.1% for egg or embryo banking, 28.3% for other reasons related to infertility, 28.0% for male factor infertility, 28.0% for diminished ovarian reserve, 16.0% for preimplantation genetic testing, 14.3% for ovulatory dysfunction, 10.7% for tubal factor, 10.4% for unexplained factor, 6.6% for endometriosis, 5.8% for recurrent pregnancy loss, 5.8% for uterine factor, 4.8% for other reasons not related to infertility, and 1.6% for gestational carrier. Because more than one reason can be reported per cycle, the total percentage adds to more than 100%.

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are included.

**Figure 4**

Percentage of ART Cycles, by Reason for Using ART, United States, 2020

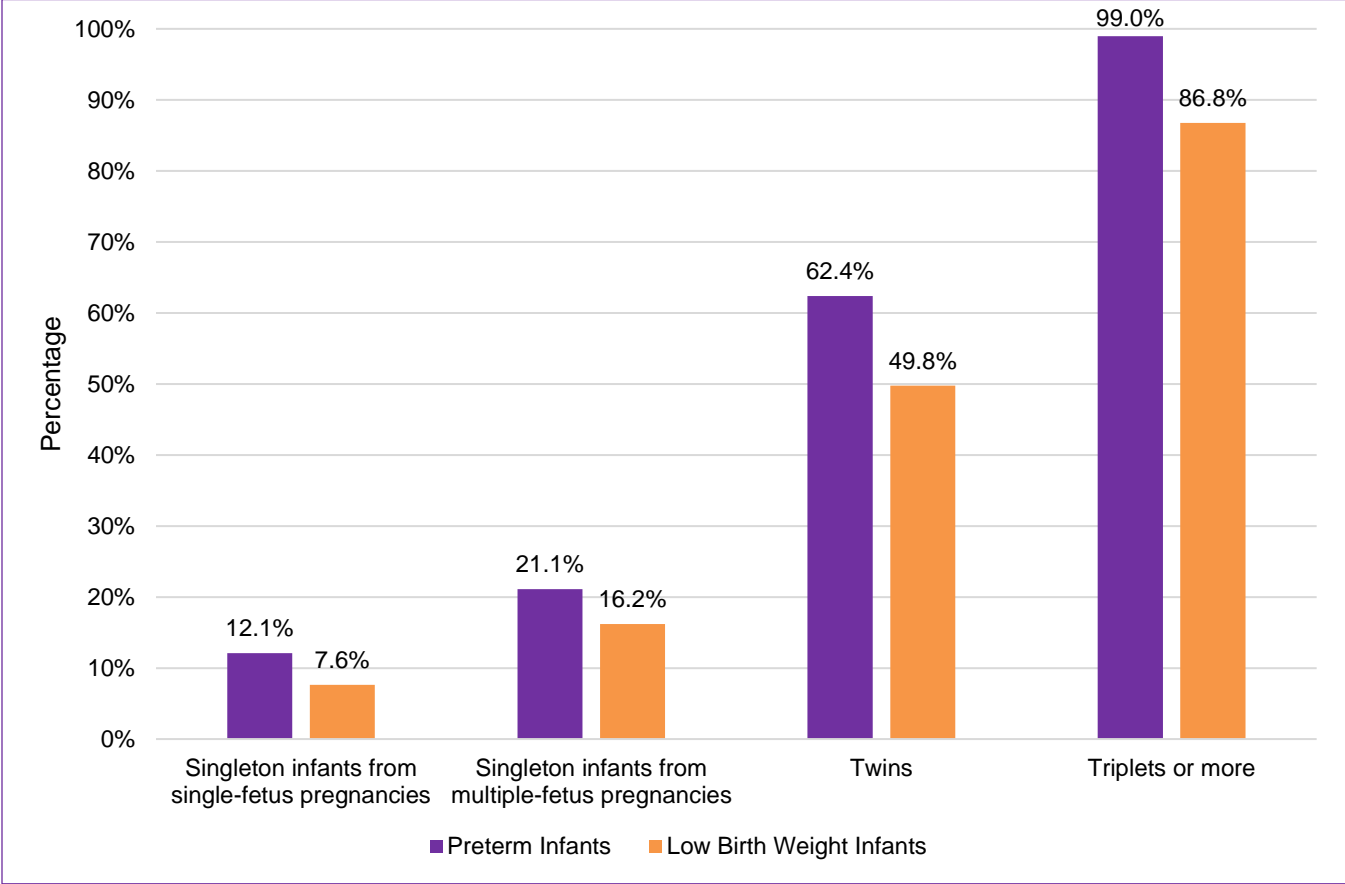

**Figure 5** shows the percentage of infants born from ART procedures started in 2020 who were born preterm or with low birth weight. This figure presents percentages for deliveries that resulted in a single live-born infant (separately for single-fetus and multiple-fetus pregnancies), twin live-born infants, and triplet or more live-born infants. Multiple-fetus pregnancies were more likely to result in infants being born preterm or with low birth weight. For example, 12.1% of single infants from single-fetus pregnancies were preterm, compared to 21.1% of single infants from multiple-fetus pregnancies. Percentages of preterm and low birth weight infants increased as the number of infants born (live or still) in one delivery increased. Among triplets or more, 99.0% were preterm and 86.8% had low birth weight.

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded.

Preterm infants are born before 37 full weeks of pregnancy. Low birth weight infants are born weighing less than 2,500 grams (about 5 pounds, 8 ounces). Infants born preterm or with low birth weight are at higher risk of death in the first year of life. They also have a higher risk of other poor health outcomes, including visual and hearing problems, intellectual and learning disabilities, and behavioral and emotional problems throughout life.

**Figure 5**  
 Percentage of Infants Conceived With ART Who Were Preterm or With Low Birth Weight, by Number of Infants Born Live or Still, United States, 2020

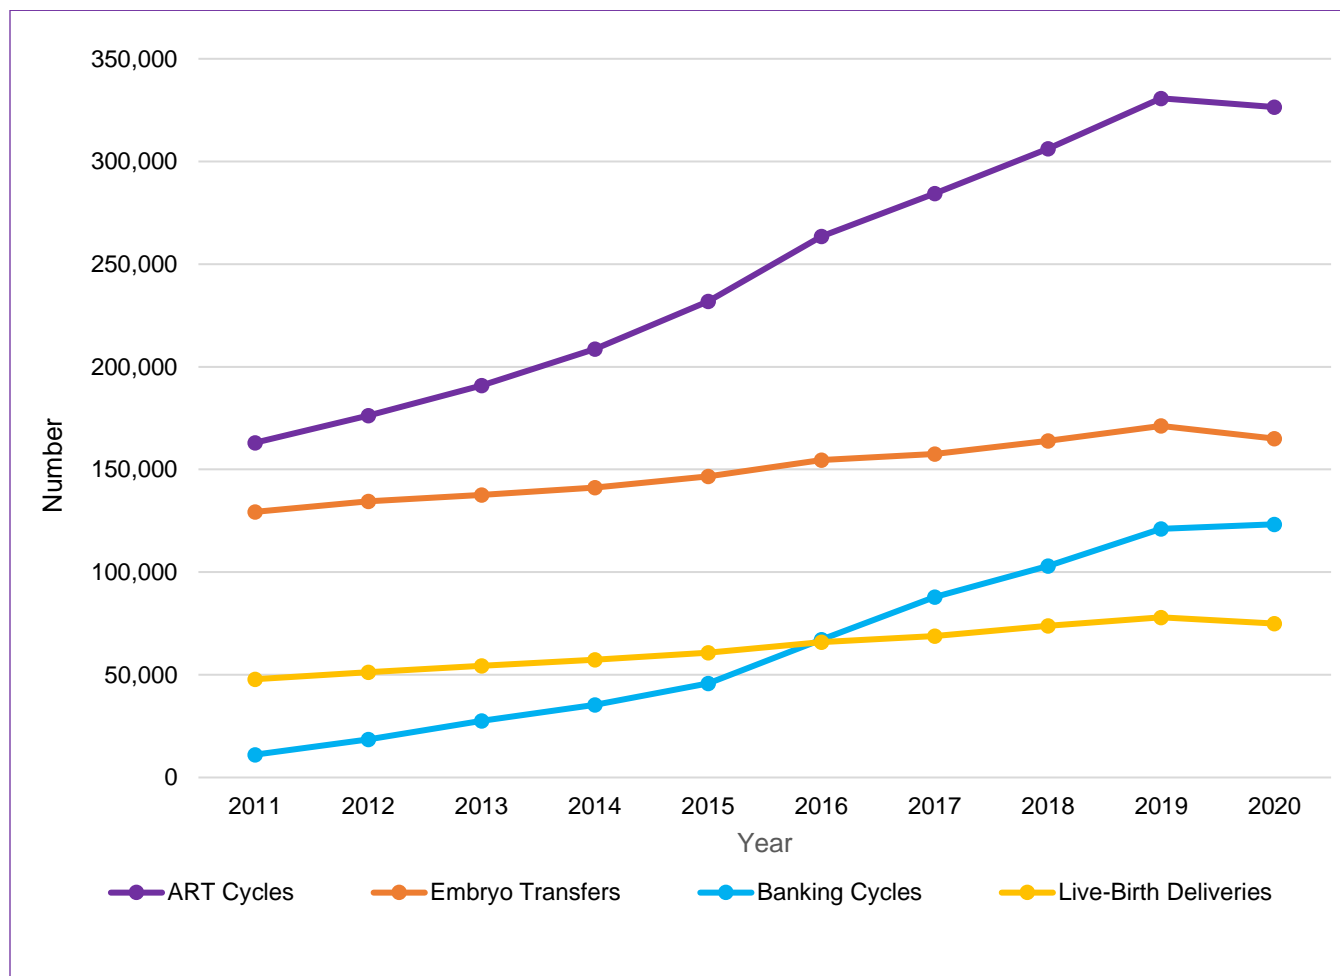

**Figure 6** shows the number of ART cycles, embryo transfer cycles, and banking cycles performed and the number of live-birth deliveries that resulted from ART cycles started from 2011 through 2020. Over the last decade, the number of ART cycles started has doubled, from 163,045 cycles in 2011 to 326,468 in 2020. Banking cycles also increased, from 11,116 in 2011 to 123,304 in 2020. The number of embryo transfer cycles in 2020 (165,041) was about 1.3 times higher than in 2011 (129,360). The number of live-birth deliveries in 2020 (75,023) was about 1.6 times higher than in 2011 (47,850).

Fresh and frozen eggs or embryos from patients and donors are included.

**Figure 6**

Number of ART Cycles, Embryo Transfer Cycles, and Banking Cycles That Were Performed and Resulted in Live-Birth Deliveries, United States, 2011–2020

**Figure 7** shows the number of ART cycles started by egg or embryo source and type, from 2011 through 2020. The number of cycles performed using embryos from fresh patient eggs decreased from 101,213 in 2011 to 49,432 in 2020. The number of cycles performed using embryos from frozen patient eggs or embryos increased from 32,180 in 2011 to 129,692 in 2020.

The number of cycles performed using embryos from fresh donor eggs decreased from 10,797 in 2011 to 1,477 in 2020. The number of cycles performed using embryos from frozen donor eggs or donated embryos increased from 7,733 in 2011 to 22,563 in 2020.

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded.

Embryos from fresh patient eggs are patient embryos from fresh eggs that were transferred without being frozen. Embryos from fresh donor eggs are donor embryos from fresh donor eggs that were transferred without being frozen. Embryos from frozen patient eggs or embryos are patient embryos that involved freezing at some point after retrieval of the egg. They include fresh embryos from frozen eggs or frozen embryos. Embryos from frozen donor eggs or donated embryos are donor embryos that involved freezing at some point after retrieval of the egg. They include fresh embryos from frozen donor eggs, frozen embryos, or donated embryos.

**Figure 7**

Number of ART Cycles, by Egg or Embryo Source, United States, 2011–2020

**Figure 8** shows the number and percentage of embryo transfer cycles that used a gestational carrier, from 2011 through 2020. Over the last decade, the number of embryo transfer cycles that used a gestational carrier increased, from 2,841 in 2011 to 9,195 in 2019, with a decrease in 2020 (7,786). The percentage of transfers using a gestational carrier among all ART cycles also increased, from 2.2% of all ART cycles in 2011 to 5.4% in 2019, with a decrease in 2020 (4.7%).

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded.

A gestational carrier (also called a gestational surrogate) is a woman who agrees to carry a developing embryo created from another woman’s egg.

**Figure 8**  
 Number and Percentage of Embryo Transfer Cycles That Used a Gestational Carrier, United States, 2011–2020

**Figure 9** shows the percentage of embryo transfer cycles in which a single embryo was transferred, from 2011 through 2020. The percentage of single embryo transfer (SET) procedures is the percentage of all embryo transfer cycles in which only one embryo is transferred to the uterus, regardless of the number of embryos available. Over the last decade, the percentage of SET among all patients increased dramatically, from 20.6% in 2011 to 80.4% in 2020, and this trend was identified among all age groups [not shown].

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded.

The use of SET is a strategy to avoid a multiple-fetus pregnancy and reduce the risk of poor health outcomes, such as prematurity and low birth weight, among infants.

**Figure 9**  
Percentage of Embryo Transfer Cycles in Which a Single Embryo Was Transferred, United States, 2011–2020

**Figure 10** shows the percentage of ART cycles that resulted in live-birth deliveries by patient age group, from 2011 through 2020. For all age groups combined, percentages increased from 31.5% in 2011 to 36.9% in 2020. Percentage increased from 39.4% in 2011 to 41.9% in 2020 for patients younger than age 35, from 32.8% in 2011 to 38.7% in 2020 for patients aged 35 to 37, from 24.9% in 2011 to 33.9% in 2020 for patients aged 38 to 40, and from 21.9% in 2011 to 27.9% in 2020 for patients older than age 40. Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded.

Over the last decade, the percentage of live-birth deliveries from ART cycles increased among all age groups. Younger patients had a higher percentage of ART cycles that resulted in live-birth deliveries than older patients. However, it is important to note that a larger proportion of older patients use donor eggs or embryos.

**Figure 10**

Percentage of ART Cycles That Resulted in Live-Birth Deliveries, by Patient Age Group, United States, 2011–2020

**Figure 11** shows the number of infants born from 2011 through 2020 who were conceived using ART. The number of infants born who were conceived using ART increased from 61,599 in 2011 to 83,946 in 2019, with a decrease in 2020 (79,942).

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded. Because more than one infant can be born during a live-birth delivery (such as twins), the total number of infants born is higher than the number of live-birth deliveries.

**Figure 11**

Number of Infants Born Who Were Conceived Through ART, United States, 2011–2020

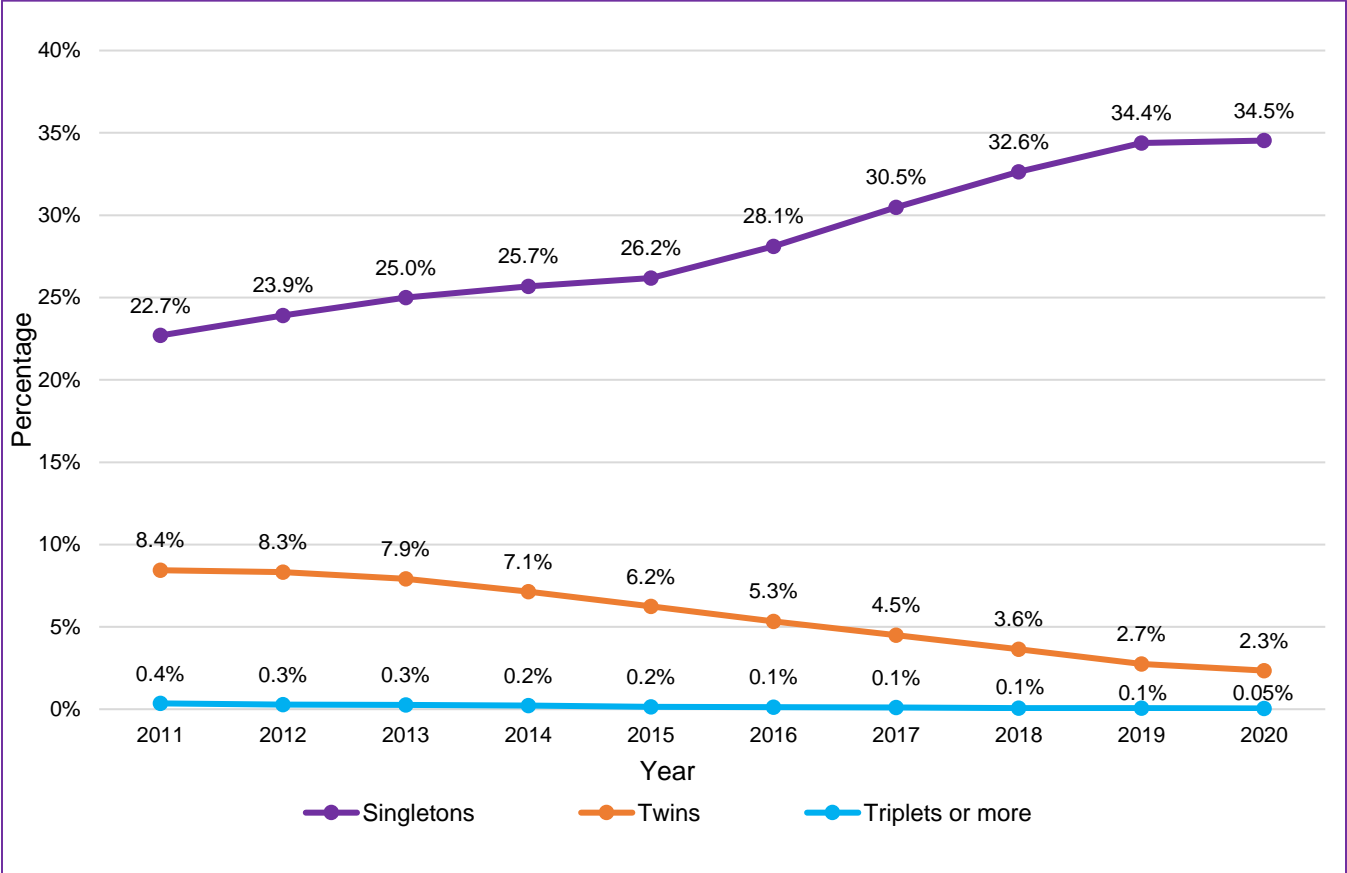

**Figure 12** shows the percentage of embryo transfer cycles that resulted in the live-birth delivery of singletons, twins, or triplets or more, from 2011 through 2020. Over the last decade, the percentage of embryo transfer cycles that resulted in singleton births increased from 22.7% in 2011 to 34.5% in 2020, while the percentage that resulted in multiple births decreased. The percentage of twins decreased from 8.4% in 2011 to 2.3% in 2020, while the percentage of triplets or more decreased from 0.4% in 2011 to 0.05% in 2020.

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded. The increased use of single embryo transfer (SET) in recent years has likely contributed to this trend. SET is used to avoid multiple-fetus pregnancies and reduce the risk of poor health outcomes, such as prematurity and low birth weight, among infants.

**Figure 12**

Percentage of Embryo Transfer Cycles That Resulted in the Live-Birth Delivery of Singletons, Twins, or Triplets or More, United States, 2011–2020

**Figure 13** shows the percentage of infants who were conceived using ART cycles that resulted in the live-birth delivery of singletons, twins, or triplets or more, from 2011 through 2020. Over the last decade, the percentage of ART-conceived live-birth deliveries that resulted in singletons increased from 72.1% in 2011 to 93.5% in 2020. The percentage that resulted in twins decreased from 26.8% in 2011 to 6.4% in 2020, while the percentage that resulted in triplets or more decreased from 1.1% to 0.1%.

Fresh and frozen eggs or embryos from patients and donors are included. Banking cycles are excluded.

Infants born from multiple gestations, including twins, are at higher risk of poor outcomes—including preterm birth, low birth weight, neurological impairments, or death—than infants born as singletons.

**Figure 13**

Percentage of ART-Conceived Live-Birth Delivery That Resulted in Singletons, Twins, or Triplets or More, United States, 2011–2020

# Appendix A: Data Validation

## Data Validation

Meetings with assisted reproductive technology (ART) clinics for validation of ART data were conducted from April through June 2022.

For data validation, 35 of the 449 reporting clinics were randomly selected after taking into consideration the number of ART cycles performed at each clinic, some cycle and clinic characteristics, and whether the clinic had been selected before. During each validation meeting, ART data reported by the clinic to CDC were compared with information documented in medical records.

For each clinic, the fully validated sample included up to 40 cycles resulting in pregnancy and up to 20 cycles not resulting in pregnancy. Up to 10 cycles using donor eggs or embryos were included among the fully validated sample at each clinic. In addition, among patients whose cycles were fully validated, the number of ART cycles performed during the year was verified. For each of these patients, the total number of cycles reported was compared with the total number of cycles in the medical record. If unreported ART cycles were identified in selected medical records, up to 10 of these cycles were also selected for partial validation.

To assess discrepancy rates, 2,070 ART cycles across the 35 randomly selected clinics were randomly selected for full validation, along with 294 fertility preservation banking cycles selected for partial validation. Validation results from non-randomly selected clinics (targeted validation) were not included in the calculation of discrepancy rates since they cannot be generalized to all reporting clinics. Discrepancy rates for the validated items of interest are presented in a table later in this section.

## How to Interpret Confidence Intervals for Discrepancy Rates

### What is a confidence interval?

Simply speaking, confidence intervals are a useful way to consider the margin of error, which is a statistic often used in voter polls to indicate the range within which a value is likely to be correct. For example, 30% of voters favor a particular candidate, with a margin of error of plus or minus 3.5%.

### Why do we need to consider confidence intervals if we already know the exact discrepancy rates for each clinic?

No discrepancy rate or statistic is absolute. Suppose that, during validation, a sample of 100 cycles was reviewed, and a discrepancy rate of 15% was determined for a particular data item, with a 95% confidence interval of 10% to 20%. The 15% discrepancy rate tells us that we estimate the average chance that a discrepancy occurred for the selected data field among all reported cycles to be 15%, based on the results of our sample of 100 cycles. However, that estimated discrepancy rate may not match the true discrepancy rate that we would calculate if we were to validate every single cycle during a reporting year.

The 95% confidence interval tells us that we are 95% confident that the true discrepancy rate is 10% to 20%. In other words, if we were to repeat the process of selecting a sample of 100 cycles many times, calculating the discrepancy rate and 95% confidence interval for each sample, we would expect 95% of the calculated confidence intervals to capture the true discrepancy rate.

**Table. Discrepancy Rates by Data Fields Selected for Validation**

An accessible version of this table is available on the [Data Validation](#) section of the ART report website.

Data Field Name	Discrepancy Rate <sup>a</sup> (Confidence Interval <sup>b</sup> )	Comments
Patient date of birth	0.3% (0.1,1.0)	
Cycle intention	0.6% (0.2, 1.8)	
Cycle start date	3.8% (1.4,10.1)	For 61% of discrepancies, the cycle start date reported by the clinic was later than the cycle start date found in medical records, and 77% of discrepancies were within 7 days of the reported date.
Date of egg retrieval	0.2% (0.1,0.8)	
Number of embryos transferred	0.2% (0.1,0.6)	
Outcome of ART treatment (pregnant or not pregnant)	0.1% (0.0,0.2)	
Pregnancy outcome (such as miscarriage, live birth, or stillbirth)	0.4% (0.1,1.4)	
Date of pregnancy outcome	1.0% (0.4,2.5)	For 68% of discrepancies, the date of pregnancy outcome was reported by the clinic but was not found in medical records, or vice versa. When the date of pregnancy outcome was found in both sources, about 58% of discrepancies were within 7 days of the reported date.
Number of infants born	0.3% (0.1,1.5)	
Cycle count	2.0% (0.8,4.8)	For 70% of discrepancies, the number of cycles found in medical records was higher than the number of cycles reported by the clinic. For 91% of discrepancies, there was one cycle difference between the number of cycles reported by the clinic and the number of cycles found in medical records.

**Table. Discrepancy Rates by Data Fields Selected for Validation (*continued*)**

<b>Data Field Name</b>	<b>Discrepancy Rate<sup>a</sup> (Confidence Interval<sup>b</sup>)</b>	<b>Comments</b>
Patient Diagnosis—Reason for ART		
Tubal factor	0.9% (0.5,1.7)	
Ovulatory dysfunction	2.4% (1.3,4.2)	Ovulatory dysfunction was underreported. For 73% of discrepancies, ovulatory dysfunction was found in medical records, but was not reported by the clinic.
Diminished ovarian reserve	1.5% (0.6,3.3)	Diminished ovarian reserve was overreported. For 55% of discrepancies, diminished ovarian reserve was reported by the clinic, but was not found in medical records.
Endometriosis	0.4% (0.1,1.0)	
Uterine factor	0.6% (0.2,1.9)	
Male factor	1.3% (0.6,3.1)	Male factor was underreported. For 67% of discrepancies, male factor was found in medical records, but was not reported by the clinic.
Other factor	4.9% (2.5,9.7)	Other factor was underreported. For 65% of discrepancies, other factor was found in medical records, but was not reported by the clinic.
Unknown factor	1.0% (0.4,3.1)	Unknown factor was overreported. For 87% of discrepancies, unknown factor was reported by the clinic, but was not found in medical records.

ART = assisted reproductive technology.

<sup>a</sup> Discrepancy rates estimate the proportion of all ART cycles with differences for a particular data item. Discrepancy rate calculations weight the data from validated cycles to reflect the overall number of cycles performed at each clinic. Thus, findings from larger clinics were weighted more heavily than those from smaller clinics.

<sup>b</sup> This table shows a range, called the 95% confidence interval, that conveys the reliability of the discrepancy rate. A general explanation of confidence intervals is provided earlier in this section.

# Appendix B: Glossary of Terms

**American Society for Reproductive Medicine (ASRM).** Professional society whose affiliate organization, the Society for Assisted Reproductive Technology (SART), is composed of clinics and programs that provide ART.

**ART (assisted reproductive technology).** All treatments or procedures that include the handling of human eggs or embryos to help a woman become pregnant. ART includes, but is not limited to, in vitro fertilization (IVF), gamete intrafallopian transfer (GIFT), zygote intrafallopian transfer (ZIFT), tubal embryo transfer, egg and embryo cryopreservation, egg and embryo donation, and gestational surrogacy.

**ART cycle.** An ART cycle starts when a woman begins taking fertility drugs or having her ovaries monitored for follicle production. If eggs are produced, the cycle progresses to egg retrieval. Retrieved eggs are combined with sperm to create embryos. If fertilization is successful, at least one embryo is selected for transfer. If implantation occurs, the cycle may progress to clinical pregnancy and possibly live-birth delivery. ART cycles include any process in which (1) an ART procedure is performed, (2) a woman has undergone ovarian stimulation or monitoring with the intent of having an ART procedure, or (3) frozen embryos have been thawed with the intent of transferring them to a woman.

**Canceled cycle.** An ART cycle in which ovarian stimulation was performed but the cycle was stopped before eggs were retrieved or before embryos were transferred. Cycles are canceled for many reasons. For example, eggs may not develop, the patient may become ill, or the patient may choose to stop treatment.

**Cryopreservation.** The practice of freezing eggs or embryos from a patient's ART cycle for potential future use.

**Diminished ovarian reserve.** This diagnosis means that the ability of the ovary to produce eggs is reduced. Reasons include congenital, medical, or surgical causes.

**Donor egg cycle.** An ART cycle in which an embryo is formed from the egg of one woman (the donor) and then transferred to another woman (the recipient). Sperm from either the recipient's partner or a donor may be used.

**Donated embryo cycle.** An ART cycle in which an embryo that is donated by a patient or couple who previously underwent ART treatment and had extra embryos available is transferred to another woman (the recipient).

**Ectopic pregnancy.** A pregnancy in which the fertilized egg implants in a location outside of the uterus—usually in the fallopian tube, the ovary, or the abdominal cavity. Ectopic pregnancy is a dangerous condition that must receive prompt medical treatment.

**Egg.** A female reproductive cell, also called an oocyte or ovum.

**Egg or Embryo banking cycle.** An ART cycle started with the intent of freezing (cryopreserving) all resulting eggs or embryos for potential future use.

**Egg retrieval (also called oocyte retrieval).** A procedure to collect the eggs contained in the ovarian follicles.

**Egg transfer (also called oocyte transfer).** The transfer of retrieved eggs into a woman's fallopian tubes through laparoscopy. This procedure is used only in gamete intrafallopian transfer (GIFT).

**Embryo.** An egg that has been fertilized by a sperm and has then undergone one or more cell divisions.

**Embryo transfer.** Placement of embryos into a woman's uterus through the cervix after IVF. In zygote intrafallopian transfer or gamete intrafallopian transfer, zygotes or gametes are placed in a woman's fallopian tube.

**Endometriosis.** A medical condition that involves the presence of tissue similar to the uterine lining in locations outside the uterus, such as the ovaries, fallopian tubes, or abdominal cavity.

**Fertility Clinic Success Rate and Certification Act of 1992.** Law passed by the US Congress in 1992 requiring all clinics performing ART in the United States to annually report their success rate data to the Centers for Disease Control and Prevention (CDC).

**Fertility preservation cycle.** An ART cycle started with the intent of freezing and banking all eggs or embryos for at least 12 months for future use.

**Fertilization.** The penetration of the egg by the sperm and the resulting combining of genetic material that develops into an embryo.

**Fetus.** The unborn offspring from the eighth week after conception to the moment of birth.

**Follicle.** A structure in the ovaries that contains a developing egg.

**Fresh eggs, sperm, or embryos.** Eggs, sperm, or embryos that have not been frozen.

**Fresh embryo cycle.** An ART cycle in which fresh (never frozen) embryos are transferred to the woman. The fresh embryos are conceived with fresh or frozen eggs and fresh or frozen sperm.

**Frozen egg cycle.** An ART cycle in which frozen (cryopreserved) eggs are thawed and fertilized, and then the resulting fresh embryo is transferred to the woman. Frozen and thawed eggs may be fertilized with either fresh or frozen sperm.

**Frozen embryo cycle.** An ART cycle in which frozen (cryopreserved) embryos are thawed and transferred to the woman. Frozen embryos may have been conceived using fresh or frozen eggs and fresh or frozen sperm.

**Gamete.** A reproductive cell, either a sperm or an egg.

**Gestational age.** The deviation of time from estimated last menstrual period (LMP) to birth. LMP is estimated using the date of retrieval or transfer.

**Gestational carrier (also called a gestational surrogate).** A woman who gestates, or carries, an embryo that was formed from the egg of another woman with the expectation of returning the infant to its intended parents.

**Gestational sac.** A fluid-filled structure that develops within the uterus early in pregnancy. In a normal pregnancy, a gestational sac contains a developing fetus.

**GIFT (gamete intrafallopian transfer).** An ART procedure that involves removing eggs from the woman's ovary and using a laparoscope to place the unfertilized eggs and sperm into the woman's fallopian tube through small incisions in her abdomen.

**ICSI (intracytoplasmic sperm injection).** A procedure in which a single sperm is injected directly into an egg; this procedure is commonly used to overcome male infertility problems.

**Implantation rate.** A measurement of ART success when the ART cycle results in an intrauterine clinical pregnancy, defined as the larger of either the maximum number of fetal hearts detected by ultrasound or the maximum number of infants born, including live-birth deliveries and stillbirths, out of the total number of embryos transferred.

**Infertility.** In general, infertility refers to the inability to conceive after 12 months of unprotected intercourse. Women aged 35 or older unable to conceive after 6 months of unprotected intercourse generally are considered infertile for the purpose of initiating medical treatment.

**IUI (intrauterine insemination).** A medical procedure that involves placing sperm into a woman's uterus to facilitate fertilization. IUI is not considered an ART procedure because it does not involve the manipulation of eggs.

**IVF (in vitro fertilization).** An ART procedure that involves removing eggs from a woman's ovaries and fertilizing them outside her body. The resulting embryos are then transferred into a woman's uterus through the cervix.

**Live-birth delivery.** The delivery of one or more infants with at least one born alive.

**Male factor infertility.** Any cause of infertility due to low sperm count or problems with sperm function that makes it difficult for a sperm to fertilize an egg under normal conditions.

**Miscarriage (also called spontaneous abortion).** A pregnancy ending in the spontaneous loss of the embryo or fetus before 20 weeks of gestation.

**Multiple-fetus pregnancy.** A pregnancy with two or more fetuses, determined by the number of fetal hearts observed on an ultrasound.

**Multiple live-birth delivery.** The delivery of more than one infant with at least one born alive.

**National ART Surveillance System (NASS).** Web-based data collection system used by all ART clinics to report data for each ART procedure to CDC.

**Oocyte.** The female reproductive cell, also called an egg.

**Other reason, infertility.** Reason for using ART, including immunological problems, chromosomal abnormalities, cancer chemotherapy, and serious illnesses.

**Other reason, non-infertility.** Reason for using ART not related to infertility and not unexplained or unknown.

**Ovarian hyperstimulation syndrome.** A possible complication of ovarian stimulation or ovulation induction that can cause enlarged ovaries, a distended abdomen, nausea, vomiting or diarrhea, fluid in the abdominal cavity or chest, breathing difficulties, changes in blood volume or viscosity, and diminished kidney perfusion and function.

**Ovarian monitoring.** The use of ultrasound or blood or urine tests to monitor follicle development and hormone production.

**Ovarian stimulation.** The use of drugs (oral or injected) to stimulate the ovaries to develop follicles and eggs.

**Ovulatory dysfunction.** A diagnostic category used when a woman's ovaries are not producing eggs normally. It is usually characterized by irregular menstrual cycles reflective of ovaries that are not producing one mature egg each month. It includes polycystic ovary syndrome and multiple ovarian cysts.

**Patient (nondonor) cycle.** An ART cycle in which an embryo is formed from the egg of the patient and either partner or donor sperm and then transferred back to the patient.

**PGT (preimplantation genetic testing).** Diagnostic or screening techniques performed on embryos before transfer to (1) detect specific genetic conditions to reduce the risk of passing inherited diseases to children or (2) screen for an abnormal number of chromosomes, which is of special value for patients with advanced age, recurrent miscarriages, or prior failed IVF.

**Pregnancy (clinical).** A pregnancy documented by ultrasound that shows a gestational sac in the uterus. For ART data-reporting purposes, pregnancy is defined as a clinical pregnancy rather than a chemical pregnancy (positive pregnancy test).

**SET (single embryo transfer).** Procedure in which one embryo, regardless of how many embryos are available, is placed in the uterus or fallopian tube. The embryo selected for SET might be a frozen (cryopreserved) embryo from a previous IVF cycle or a fresh embryo from the current fresh IVF cycle.

**Singleton live-birth delivery.** The delivery of a single infant born alive. Singleton live-birth delivery does not include the delivery of more than one infant with only one born alive.

**Society for Assisted Reproductive Technology (SART).** An affiliate of ASRM composed of clinics and programs that provide ART.

**Sperm.** The male reproductive cell.

**Spontaneous abortion.** See Miscarriage.

**Stillbirth.** The birth of an infant that shows no sign of life after 20 or more weeks of gestation.

**Stimulated cycle.** An ART cycle in which a woman receives oral or injected fertility drugs to stimulate her ovaries to develop follicles that contain mature eggs.

**Thawed embryo cycle.** Same as frozen embryo cycle.

**Tubal factor infertility.** A diagnostic category used when the woman's fallopian tubes are blocked or damaged, making it difficult for the egg to be fertilized or for an embryo to travel to the uterus.

**Ultrasound.** A technique used in ART for visualizing the follicles in the ovaries, the gestational sac, or the fetus.

**Unexplained infertility.** A diagnostic category used when no cause of infertility is found in either the woman or the man.

**Unstimulated cycle.** An ART cycle in which the woman does not receive drugs to stimulate her ovaries to produce more follicles and eggs. Instead, follicles and eggs develop naturally.

**Uterine factor infertility.** A structural or functional disorder of the uterus that results in reduced fertility.

**ZIFT (zygote intrafallopian transfer).** An ART procedure in which eggs are collected from a woman's ovary and fertilized outside her body. A laparoscope is then used to place the resulting zygotes into the woman's fallopian tube through a small incision in her abdomen.

**Zygote.** A fertilized egg before it begins to divide.

# Appendix C: ART Clinics

## 2020 Reporting Clinics, by State

Clinics are listed alphabetically by their current name, city, and state location at the time of reporting 2020 data. If a clinic had a different name at the beginning of 2020, the clinic's former name on January 1, 2020, is listed in italics directly under the current name.

Clinic names preceded by the § symbol have reorganized since January 1, 2020. Reorganization is defined as a change in ownership or affiliation or a change in at least two of the three key staff positions (practice director, medical director, or laboratory director) because the staff in those positions are no longer employed at the clinic. Clinic names preceded by the † symbol have closed since January 1, 2020. Clinics or labs operating under a name different from their legal name have "Doing Business As" (dba) between their legal and current operating name. For further clinic information, contact the NASS HelpDesk at 1-888-650-0822 or [nass@westat.com](mailto:nass@westat.com).

The accrediting agencies referenced throughout this list are:

- College of American Pathologists (CAP), Reproductive Laboratory Accreditation Program
- The Joint Commission

**NOTE** that CDC does not oversee either of these accreditation programs. In 2021, the New York State Tissue Bank Program stopped providing accreditation for embryo laboratories.

### ALABAMA

Alabama Fertility Specialists  
3490 Independence Dr  
Birmingham AL 35209  
Telephone: (205) 874-0000; Fax: (205) 874-7021  
Lab Name: Alabama Fertility Specialists Laboratory  
Accreditation: CAP

University of Alabama at Birmingham

## 2020 Nonreporting Clinics, by State

The clinics listed below provided ART services and were in operation as of January 1, 2020. They were required to submit ART cycle data under the provisions of the Fertility Clinic Success Rate and Certification Act passed by the US Congress. These clinics either failed to submit data or the clinic's medical director did not approve the clinic's 2020 ART data for inclusion in this report.

Consumers who are aware of a clinic that was operating in 2020, but is not listed in this report as either a reporting or nonreporting clinic are encouraged to contact CDC with the complete name, mailing address, and telephone number of the clinic. Providing this information will help ensure that clinics that should be in the ART reports are included in the future.

Send this information by email to [artinfo@cdc.gov](mailto:artinfo@cdc.gov) or by postal service to:

CDC, ATTN: ART Surveillance and Research Team  
4770 Buford Highway, NE  
Mail Stop S107-2  
Atlanta, GA 30341-3717

Clinic names preceded by the † symbol have closed since January 1, 2020.
